You can use **GROUP BY** to group values from a column, and, if you wish, perform calculations on that column. You can use COUNT, SUM, AVG etc function on the grouped column.

To understand **GROUP BY** clause consider an **employee_tbl** table which is having following records:

```
mysql> SELECT * FROM employee_tbl;
id | name | work_date | daily_typing_pages |
+-----
   1 | John | 2007-01-24 |
    2 | Ram | 2007-05-27 |
                                     220
    3 | Jack | 2007-05-06 |
                                     170
    3 | Jack | 2007-04-06
                                     100
    4 | Jill | 2007-04-06
                                    220
   5 | Zara | 2007-06-06
                                    300
   5 | Zara | 2007-02-06 |
                                    350
7 rows in set (0.00 sec)
```

Now suppose based on the above table we want to count number of days each employee did work.

If we will write a SQL query as follows then we will get following result:

But this is not serving our purpose, we want to display total number of pages typed by each person separately. This is done by using aggregate functions in conjunction with a **GROUP BY** clause as follows:

```
mysql> SELECT name, COUNT(*)
    -> FROM employee_tbl
    -> GROUP BY name;
+----+
    | name | COUNT(*) |
+----+
    | Jack | 2 |
    | Jill | 1 |
    | John | 1 |
    | Ram | 1 |
    | Zara | 2 |
+-----+
5 rows in set (0.04 sec)
```

We will see more functionality related to GROUP BY in other functions like SUM, AVG etc.
